

Screening in. IEP goals out.

One structured AAC session produces a starter board spec and a full set of goals across all four DAGG competencies — each one citing the probe that produced it.

SESSION

SELECTION PROCESS

How the grid gets picked

Demographics set the starting point. Live probe performance sets the recommendation. Where the two disagree, observed performance wins.

01 Intake sets the prior

Four fields position the learner and choose the fringe vocabulary frame before any probe runs.

Age band

Etiology

Comm level

Suspected access

02 Probes overrule it

Every subtest is scored on accuracy and latency. The largest grid the learner hits correctly sets the band.

Touch / scan / gaze

Grid sweep

Library head-to-head

03 Confidence gates it

The session scores its own reliability. Below threshold it escalates to a Targeted Eval instead of guessing.

Adult onset or acquired

GRID ANALYSIS

Five bands, chosen by evidence

Tuned so 60 and 84 are the common outcomes for a learner performing well, with 24 as the conservative floor when data is thin.

GOAL OUTPUT · DYNAMIC AAC GOALS GRID

Four domains, filled in one pass

Goals arrive with the session's own measurements already interpolated — the operational goal carries the recommended grid and access method.

Linguistic

“Core vocabulary across 4 communication functions.”

CITES VOCAB BAND

Operational

“Locate targets on a 7×12 grid, 80% accuracy.”

CITES GRID SIZE

Social

“3 communicative turns per 10-minute interaction.”

PARTNER-MEDIATED

Strategic

“Repair breakdowns using the secondary access method.”

CITES SECONDARY ACCESS

FOR THE SLP

What you stop doing by hand

Writing the evidence line

Every goal carries the field that produced it.

Second-guessing thin data

A weak session escalates itself and names why.

Building the first board

The starter spec ships with the recommendation.

Backfilling social goals

All four competencies populate in the same pass.

Reformatting for the team

The PDF is generated from the same logic as the screen.

Hunting for a signal

Scoring runs on-device, so rural and home visits work.

See Quick Eval on a real caseload

A screening instrument — it structures clinical judgment, never replaces it.

GOALS GRID

DAGG-style IEP goal suggestions

Derived from the recommendation across Light's four communicative competencies. Edit before pasting into an IEP.

LINGUISTIC

Increase single-symbol vocabulary by 5 words per week.

Combine two symbols to make a request.

OPERATIONAL

Locate target buttons on a 7×12 grid with 80% accuracy.

Navigate from home board to a category folder and back independently.

SOCIAL

Initiate at least 3 communicative turns per 10-minute interaction.

Respond to a partner question with at least 1 device-mediated turn within 10s.

STRATEGIC

Repair a communication breakdown using a second access method or symbol library.

Request help from a communication partner when an intended word is unavailable.

SLP NOTES (OPTIONAL)

Behaviors observed, follow-up plan, or anything the auto-score missed...
